Subject: Comment regarding proposed cleanup plan for the Olin Chemical Site

Dear Ms. Morash,

Regarding cleanup of the Olin Chemical Superfund site, I support all of the feedback given by the MIT Superfund Research Program (MIT SRP). Specifically, I believe it is important to identify and monitor additional nitrosamines with harmful health effects, beyond just monitoring N-nitrosodimethylamine (NDMA), in the dense aqueous phase liquid (DAPL), light non-aqueous phase liquid (LNAPL), and groundwater. Additionally, it is necessary to monitor the presence of known nitrosamine precursors due to their potential to perpetuate the formation of NDMA, and to put in place a more aggressive remediation strategy for these substances (such as excavation and/or containment).

Best,
Kristen Riedinger
